

FORGED STRENGTH

***The lightest,
the strongest***

The strongest

Alcoa wheels are not just the lightest on the market. Approved tests show they're also the strongest.

Your best option when you need to keep the weight down and still be sure of top quality.

What makes forged aluminium wheels so strong?

In the forging process, the granular structure of the aluminium is pressed to follow the shape of the wheel. This makes the wheels incomparably strong.

Approved tests show it!

To crush an Alcoa wheel 5 centimetres takes a force of 71,200 kg. It only takes 13,600 kg to crush a steel wheel by the same amount. In other words: Alcoa wheels are more than 5 times stronger!
